

Using USB Cameras

Using USB Cameras

1. Environment Setup
2. How to Run
3. Expected Result

The development board has the `usb_camera_snap.py` program installed to test the data pipeline of USB cameras. This example captures real-time image data from a USB camera and saves it locally as `img.jpg`.

1. Environment Setup

- Connect the USB camera to the development board and confirm that the `/dev/videox` device node is created, where `x` is a number (e.g., `/dev/video0`).
- Connect the development board to a display using an HDMI cable.

2. How to Run

- Execute the program with the following commands:

```
sunrise@ubuntu:~$ cd /app/pydev_demo
sunrise@ubuntu:/app/pydev_demo$ PYTHONPATH=/app/pydev_demo python
usb_camera_sample/usb_camera_yolov5x.py
```

3. Expected Result

After running the program, the display will capture and show the current camera frame, as shown below:
